Dear George,

The optical arrangement of the enlarger and the mechanical arrangement of the counters is such that if the frame numbers are printed and the co-ordinates measured while holding the input spool as shown on the attached sketch, the frame numbers will read correctly in the viewer and the counters will add in the proper direction.

Other arrangements will require either writing or reading backwards or upside-down. The counter for the vertical direction can be modified to add in the opposite direction; having the horizontal counter add in the opposite direction would require a new counter.

Please confirm that this arrangement is satisfactory.

Very truly

Leon
